

VERIFICATION REPORT · JULY 10-11, 2026

Factual and visual verification of the INSITE package, looped to clean | HGF Management Company

Full visual and factual verification of every artifact built to date. Loop run to clean.

Prepared for Dennis Lanni | HGF Management Company

Method: six verification agents (scripts) plus page-by-page visual inspection, adapted from the visual-verify loop discipline. Loop repeated until the final sweep returned clean.

Agents run

- Agent M, mechanical text:** every PDF and markdown scanned for double numbering, mojibake, formatting leaks, em dashes, and recipient-rule violations.
- Agent C, locked-corrections compliance:** banned claim phrasing, PACE framing, school-fee exclusion framing, labeled-estimate rules, and the standard pre-launch disclaimer on every document.
- Agent D, data recompute:** Census figures recomputed from the downloaded primary files (103,856 total; 62,372 in 1-4 unit structures: match); market math, BOLD average, note-sizing example, and date arithmetic all re-derived: pass.
- Agent L, links:** all 50 cited URLs probed.
- Agent T, truth audit:** every checklist "done" item asserted against reality (file existence, verify_map.py pass, 13 brand assets readable).
- Agent S, sync integrity:** outputs tree hash-compared against the working tree.

Visual pass: every page of every PDF rasterized into labeled contact sheets (plan set, program set, brand assets) and inspected: bands, tables, lists, and footers render correctly; no overflow, blanks, or broken pages.

Findings and dispositions

#	Finding	Severity	Disposition
1	Seven documents of unknown provenance (INS-002 whitepaper, INS-201 checklist, five OPERATIONS manuals) appeared in the working tree at 05:12-05:18, not produced by this run; on-arrival scan showed recipient-rule violations, 100+ em dashes, and unframed school-fee and PACE mentions	HIGH	Quarantined to 09_QUARANTINE_UNVERIFIED with a README; never synced to the deliverable package; adopt-or-discard decision queued as Q7
2	Primer heading said "Twelve questions" after Q13 was added	HIGH	Fixed to Thirteen; rebuilt
3	INS-003, INS-004, INS-005 footers lacked the full "not an offer of financing" disclaimer	HIGH	Standard disclaimer block applied to all three; rebuilt
4	Claims Register contained 10 em dashes (banned style)	MED	Replaced; register is markdown-only
5	CSCDA goals-and-policies PDF returned 404 to direct curl (load-bearing 4:1 citation)	HIGH	Re-verified July 10 via search fetch: document live, 4:1 language confirmed verbatim; stable landing page added to citations. Bonus verification captured: CSCDA's 2 percent total-tax-burden cap, added as claim A3b and folded into INS-003
6	Link template with a placeholder tripped the checker	LOW	Reworded in the register
7	Scanner false positives (disclaimer phrase split by line wrap; "do not say" table rows; register's quoted banned claim)	n/a	Scanner corrected: whitespace normalization and context allowlists; documents were already correct

Link check results

42 of 50 URLs return 2xx/3xx. Remainder: cscda.org (406) and four sites returning 403 are bot-blocks, each re-verified readable via search fetch this run; planning.lacity.gov returned 200 on retry (content was fetched and logged during the original research pass); the placeholder template was reworded. No citation in the package rests on a dead source.

New verifications gained during the loop

- CSCDA 2 percent total-tax-burden policy (claim A3b), now citable in RMA sizing discussions.
- Elk Grove staff report: cities in these programs act as intermediaries with "no financial liability or risk" (claim E6), direct

precedent language for the city pitch.

Residuals, intentionally open

1. DCF workbook: the two known formula defects remain in place pending Dennis's go-ahead to fix (logged since the prior session).
2. Quarantined documents: Q7 decision required.
3. Final skeptic re-pass (checklist 1.12) still gates the end-of-run handoff, as planned.

Second full-package pass, July 11 (post-completion loop)

All agents re-run against the finished 69-file package. Content findings: **zero**. The loop instead caught and fixed three items in the verification infrastructure itself:

1. **Agent W false negative.** The workbook-defect detector matched relative references (!B9) while the actual formulas use absolute notation (!B\$9), so it reported zero known defects. Pattern corrected; it now detects all 120 defect-bearing cells (2 rows across 60 month columns). The defects themselves are confirmed present and precisely recorded: DCF Model row 5 (Remaining Hard Costs) conditions on and divides by Market Assumptions B9, "Builder Incentives" (value 0), which silently zeroes hard costs instead of spreading them over the 12-month Development Cost Period in B10; row 6 (Remaining Soft Costs) uses B10 where the Soft Cost Period in B11 belongs. Corrected formulas are staged, gated on question 8. Hash comparison proves the carried workbook is bit-identical to the original, so package integrity holds.
2. **Stale quality-control screenshots.** The packaged website captures predated the number-formatting fix and showed uncommaed figures. Both recaptured from the shipped page; the rendered text layer again proves the calculator executes and now reads \$2,298.
3. **Human-review pack refreshed.** The image viewer remained unavailable this session (two failed attempts on known-good files), so fresh contact sheets of every current document (plan set, program set, marketing set) were regenerated and packaged at 07_BUILDLOG/qc alongside the deck thumbnails and site screenshots. The one-look human pass before printing remains the standing recommendation.

Re-verified this pass: calculator (\$2,298 / \$250,000 / zero-rate edge), deck schema (All validations PASSED), structure map audit (PASS), Census recompute from primary files (match), outputs hash sync (zero stale), quarantine still excluded from deliverables. Links: 51 checked, 48 clean; the three failures are the same bot-blocked pages (Elk Grove program page, one law-blog explainer, Vacaville program page), each previously verified readable through a second route; no citation rests on a dead source.

Third pass, July 11: a defect the loop missed, and the agent that now exists because of it

A human browser caught what two automated loops did not: inside the navy who-it-serves band of the website, the white audience cards inherited the band's light text colors, rendering headings white-on-white (contrast ratio 1.00) and bullets at 1.17. Why every prior check was blind to it: the text-layer sweeps verify that words exist regardless of color; the token checks matched every string; and the ink-density audit classified the pale text as background (the text color sums to 715 on a 0-765 scale against a threshold of 650). Presence, structure, and execution were all verified; legibility never was.

The fix is three CSS rules. The lasting fix is tools/contrast_check.py, a contrast agent that injects a script computing the WCAG contrast ratio of every text-bearing element against its effective background and reports through the proven render pipeline. On the pre-fix page it flags all 15 failures; the fixed page and all four other web artifacts pass at 3.0:1 or better. Screenshots recaptured; card-band dark-ink measurement confirms visible text where there was none.

Status: final sweep CLEAN. Package integrity confirmed. The user-visible outputs tree was never contaminated by the quarantined files.

INSITE™ is a pre-launch program concept administered by HGF Management Company. Internal quality-control record. Not an offer of financing, legal advice, or investment advice.
